

Case Study 2: How Can A Wellness Company Play It Smart?

Intro: Bellabeat is a high-tech company that designs smart wellness products for women. Their mission is to help their users understand their daily habits and make informed decisions about their health and well-being. This case study shows how Bellabeat can leverage data on user behavior and develop strategies that promote healthier lifestyles.

Problem:

1. What are some trends in smart device usage?
2. How could these trends apply to Bellabeat customers?
3. How could these trends help influence Bellabeat's marketing strategy?

Bellabeat wants to understand how people use smart devices to track their daily habits, including activity, sleep, and calorie data. By studying these patterns, the company hopes to understand its target audience better and find ways to make its products more engaging and useful. Bellabeat also aims to use these insights to shape a data-driven marketing strategy that connects better with customers and encourages healthier lifestyles.

Summary: For this case study, I analyzed Fitbit smart-device data to uncover patterns in users' daily habits. I focused on activity levels, sleep duration, and calorie burn to understand how people use wellness technology in their everyday lives. By cleaning and organizing the data, I created pivot tables and charts that highlight trends across different days of the week and activity types. These insights help Bellabeat see how users balance movement and rest, and how those behaviors can guide product improvements and marketing strategies aimed at promoting healthier lifestyles.

Daily Activity Intensity Levels

Shows how much time users spend sedentary, lightly active, fairly active, and very active

Insight: Most users spend the majority of their day in sedentary or light active states, with only a small portion of time in moderate-to-high intensity activity. While users move throughout the day, sustained high-intensity exercise is limited.

Relationship Between Steps and Calories Burned

More steps generally lead to higher calorie burn

Insight: As users walk more, they expend more energy. Daily movement directly contributes to calorie output and overall wellness.

Insight: Users are most active on Saturday and least active on Sunday, showing a weekend drop-off in movement. Users may rest more after the workweek or lack motivation to stay active on Sundays.

Insight: Users sleep the longest on Sunday and the shortest on Thursday, suggesting mid-week fatigue and weekend recovery. This pattern highlights the importance of balancing rest and activity for overall wellness.

Key Findings:

- Users are more active on Saturday and least active on Sunday.
- Users sleep the longest on Sunday and the shortest on Thursday.
- The more steps users take, the more calories they burn
- Most users spend their day sedentary, with only a small portion of time in a high-intensity activity.

Recommendations:

- Encourage weekend activity. Bellabeat could introduce Sunday motivation challenges or use a gentle reminder to stay active throughout the weekend.
- Promote better sleep habits. With sleep duration dropping midweek, Bellabeat could offer Thursday evening sleep-prep tips or calming routines to help users wind down before the weekend.
- Reduce sedentary time. Most users spend their day sedentary, so Bellabeat could send hourly movement reminders or short guided stretch sessions to encourage light activity throughout the day.
- Personalized goals. Bellabeat could tailor calorie and step goals dynamically based on each user's activity patterns.
- Data-driven marketing. Bellabeat could use these insights to highlight how its products balance movement, rest, and recovery. They would show that the brand is a supportive wellness companion rather than just a fitness tracker.

Conclusion: Through this analysis, I was able to see how people use smart devices to track their daily habits. The data showed that users are most active on weekends, sleep more after the work week, and spend a lot of time sedentary during the day. These patterns give Bellabeat a better understanding of how its customers live and where it can help them improve. By using these insights, Bellabeat can design features and marketing strategies that motivate user to move more, rest better, and feel supported in their wellness journey.
